2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException
AtTheRateException
DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
import java.util.Scanner;

// Custom exception classes
class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

class EmailValidator {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        String email = scanner.nextLine();

        try {
            validateEmail(email);
            System.out.println("Valid email address");
        } catch (DotException | AtTheRateException | DomainException e) {
            System.out.println(e.getClass().getSimpleName() + ": " + e.getMessage());
            System.out.println("Invalid email address");
        }
    }

    private static void validateEmail(String email) {
        // Implementation of email validation logic
    }
}
```

```

    }
}

public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
    // Check for exactly one '@'
    int atCount = email.length() - email.replace("@", "").length();
    if (atCount != 1 || email.startsWith("@") || email.endsWith("@") ||
email.contains("@@")) {
        throw new AtTheRateException("Invalid @ usage");
    }

    // Check for dot usage
    int atIndex = email.indexOf("@");
    String afterAt = email.substring(atIndex + 1);
    int dotCountAfterAt = afterAt.length() - afterAt.replace(".", "").length();
    if (dotCountAfterAt != 1 || email.endsWith(".") || email.contains("..")) {
        throw new DotException("Invalid Dot usage");
    }

    // Check domain
    String domain = email.substring(email.lastIndexOf(".") + 1);
    if (!(domain.equals("in") || domain.equals("com") || domain.equals("net") ||
domain.equals("biz"))) {
        throw new DomainException("Invalid Domain");
    }
}
}
}

```

Status : Correct
